

## Field Treatment

1. Basic airway
2. Oxygen
3. Advanced airway prn
4. Venous access prn

①

**Note:** ②

### *NORMAL DELIVERY*

5. Assist delivery and see EMERGENCY CHILDBIRTH (New-born) **P2** guideline
6. If maternal hypotension, fluid challenge
7. After placental delivery, massage uterine fundus

### *BREECH DELIVERY*

5. Support presenting part and allow newborn to deliver
6. If head does not deliver, attempt to provide airway
7. If infant delivers, see *NORMAL DELIVERY*

### *PROLAPSED CORD*

5. Elevate hips of mother
6. Check cord for pulses
7. If no cord pulse, manually displace presenting fetal part off cord

## Special Considerations

- ① At no time should venous access take precedence over controlled delivery or emergency transport.
- ② If the amniotic sac is intact with presenting part showing, pinch and twist the membrane to rupture.
